

Panel Customization Guidelines

- 1.) We offer complete design services. We'll start from scratch or create the production files for your logo or image panels. If you choose to design your layout - the panel schematics PDF's are available here to download. Keep in mind the metal frames around the perimeter of the front & sides of our bars is 1" thick. So just account for that in your design. No bleeds necessary - we cut flush to the edge and do not trim.
- 2.) We calibrate our printers to RGB. You can send files as .PSD / .PDF / .AI (200 dpi is fine).
- 3.) For rendering purposes only we can use .JPG / .PNG files but keep in mind small resolution files will not enlarge properly for large format print.
- 4.) We will need high resolution files (bitmap or vector) to create your printed panels. When designing for Interior (such as hotel, ballroom, conference hall, home etc...) you can send images taken by cell phone so we get the idea of pattern/shape/color. If you don't have any files we have a stock photo library to choose from. Let us know what you have in mind!
- 5.) Front panel prints are done on a material that's about the thickness of an X-Ray. They are very durable. They slide into the fronts of the bars from the top down into the slot in front of the existing panel. They are removable. You can easily remove the printed panel and use your bar with the plain white panels as well. The LED light shines through the panels so any lighter areas within the design will show the most LED illumination.
- 6.) We offer side panel customization for SmartBar 5L only. Although they are also removable, the prints are adhered directly to the panel. They slide out easily but if you need a set of blank panels as well we do offer additional side sets of 2 for left & right side of the SmartBar 5L.
